

B. VIGNESH GANDHI

WEB DEVELOPMENT AND GRAPHIC DESIGNER

PROFILE

Creative and motivated Master's student with a strong interest in Web Development and Graphic Design. Skilled in building responsive websites and designing user-friendly interfaces. Passionate about creating engaging digital experiences by combining technical knowledge with creativity. Eager to learn new technologies, contribute to innovative projects, and grow in a professional environment.

EDUCATION

Bachelor of Engineering Sri Eshwar College of Engineering, Coimbatore CGPA: 7.38	2019 - 2023
Master of Engineering National Engineering College, Kovilpatti CGPA: 7.71 (upto First Semester)	2025 - 2027
Higher Secondary School St. Paul's Matriculation Higher Secondary School Marks: 410/600	2018-2019
Secondary School Leaving Certificate St. Paul's Matriculation Higher Secondary School Marks: 444/500	2016-2017

PROJECTS

Android Malware Variant Detection Using Static Features

Developed an Android malware detection system that identifies malicious applications using static feature analysis without executing the APK files. The system extracts security-relevant information from Android applications, including permissions, API calls, intent filters, and manifest-based features. Machine Learning techniques are then applied to classify applications as benign or malicious and identify malware variants.

Stock Market Trend Analysis Using Apache Spark

Built a stock market trend analysis platform using Apache Spark to process and analyze large-scale historical stock market datasets. The system performs distributed data processing, trend identification, moving average analysis, and market behavior visualization. Apache Spark's parallel computing capabilities were utilized to handle high-volume financial data efficiently and generate analytical insights.

Real-Time Click Fraud Detection in Online Advertising Using Advanced Predictive Models

Developed an intelligent fraud detection system capable of identifying invalid and fraudulent advertisement clicks in affiliate marketing and PPC environments. The system utilizes behavioral analysis, feature engineering, and machine learning algorithms to distinguish genuine user interactions from suspicious activities. Features such as click frequency, timestamp patterns, device information, and user behavior were analyzed to improve prediction accuracy.
